Ques 1) Explain the following types of database security issues: Legal and Ethical issues, Policies issues and System related Issues.

Ans 1) Legal and Ethical Issues

Legal and ethical concern the laws, regularisation, and moral responsibilities related to the storage and use of data in a database system.

Organisations must ensure they comply with data protection laws and pregularisation. Sensitive information such as personal data, financial records, and confidential business information should not be accused or should without proper authorization.

2) Policy Issues

Policy issue relates to the rules and guidelines established by an organisation to protect it's database systems. Organisation develop security policies that define how data should be accessed, policies that define how data should be occesed, used, and protected. These policies specify user roles, access rights, responsibilities of employees handling data.

3) System - related Issues

System - related issues arise due to technical issues or vulnerabilities in database systems by, hardware or software.

Q2. Explain the following database security control techique
1) Access Control 2) Interference Control 3) Flow control.
4) Data Encryption.

Database Security control techonique are methods used to protect database from unauthorized access, misuse, or data leakage.

Scanned with OKEN Scanner

1) Access Control

Access control is a technique used to restrict database access to authorized access to authorized users only. It determines who can access the database and what operation they are allowed to perform.

2) Interference Control

Inference control is used to prevent users from deducing sensitive information from non-sensitive data. Sensitive information can sometimes be accessed by users by analyzing available data or statistical results.

3) Flow Control

Flow control regulates the movement of information within a database system. It ensures that information flows only between authorized users and security levels.

4) Data Encryption

Data encryption is the process of converting readable data into an encoded format to protect it from unauthorized access.

Encrypt data can only be read by users who have the correct decryption key. encryption commonly used to

Ques) Consider a table Employee (EmpID, empName, Salary, DeptID). write a SQL query to create a view that displays only EmpID, EmpName, and DeptID from the employee table.

```
CREATE VIEW Employee_View AS
SELECT EmpID, EmpName, DeptID
FROM Employee;
```

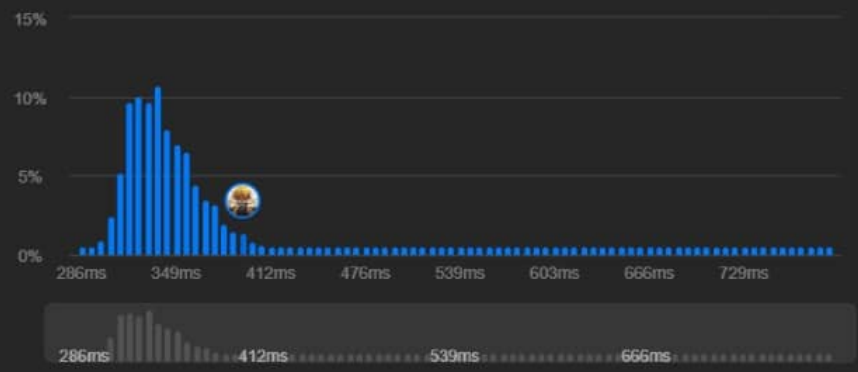
Solution

Runtime

393 ms | Beats 14.66%



Code | MySQL

```
# Write your MySQL query statement below
Select m.name

from employee as e
inner join employee as m
on e.managerId=m.id
```

Code

MySQL | Auto

```
# Write your MySQL query statement below
Select m.name

from employee as e
inner join employee as m
on e.managerId=m.id
group by e.managerId
having count(e.id)>=5
```
